(54) Title: PROPHYLACTIC TREATMENT OF UV-INDUCED EPIDERMAL NEOPLASIA

(57) Abstract: The present invention provides a method of protecting a subject against UV-induced epidermal neoplasia. Generally, the method includes administering to a subject an IRM compound in an amount effective to provide protection against UV-induced epidermal neoplasia. The present invention also provides compositions that include an IRM compound in an amount effective for providing protection against UV-induced epidermal neoplasia.

WO 2004/078138 A2

PROPHYLACTIC TREATMENT OF UV-INDUCED EPIDERMAL NEOPLASIA

5

Background

Solar radiation consists of a mixture of ultraviolet (UV) wavelengths including UVA wavelengths (about 315 nm to about 400 nm) and UVB wavelengths (about 280 nm to about 315 nm). Absorption of UV radiation by proteins and DNA increases toward the shorter wavelengths in the UVB range, as do the corresponding damaging effects of UV radiation to these molecules. UV-induced damage to DNA can give rise to neoplasia in UV-exposed tissues.

Neoplasia refers to the formation of one or more neoplasms. A neoplasm generally refers to an abnormal mass or colony of cells produced by a relatively autonomous new growth of tissue. Most neoplasms arise from the clonal expansion of a single cell that has undergone neoplastic transformation. Chemical, physical, or biological agents or events (e.g., exposure to UV radiation) can directly and irreversibly alter the genome of a cell, thereby transforming the cell to a neoplastic cell. Neoplastic cells are characterized by the loss of some specialized functions and the acquisition of new biological properties, foremost, the property of relatively uncontrolled growth. Cancer is a generic term for malignant neoplasms.

UV radiation can act as a complete carcinogen, i.e., capable, alone, of inducing neoplastic changes in cells. Alternatively, UV radiation can act as a co-carcinogen, acting in combination with one or more tumor initiators or promoters to induce neoplastic changes in cells.

The skin can be divided into two main layers: an outer layer - the epidermis - and the underlying dermis. The epidermis contains a basal germinative cell layer, proliferation of which provides cells for the continual renewal of the epidermis that is required as dead cells of the epidermal surface are sloughed off. While UV radiation can cause DNA damage to cells of both the dermis and the epidermis, the proliferative activity and high UV absorption of the epidermis can make the epidermis particularly susceptible to UV-related carcinogenesis.

UV radiation has been associated with various forms of epidermal damage including but not limited to erythema (sunburn) and DNA damage, which can lead to

epidermal neoplasia. Various forms of epidermal neoplasia can be induced by UV radiation. For example, actinic keratosis (AK), pre-AK lesions, squamous cell carcinoma (SCC), basal cell carcinoma (BCC), and malignant melanoma can be induced by UV radiation.

5 Actinic keratosis is the most frequently observed form of UV-induced epidermal neoplasia. AK lesions are premalignant lesions considered to be either carcinoma *in situ* or squamous intraepidermal neoplasia. In humans, AK often occurs in those with fair skin and/or red hair, and those having substantial exposure to the sun early in life. Incidence of AK tends to increase with the age of the population being
10 considered. The prevalence of AK tends to be higher in countries with high UV radiation and a fair-skinned population than in countries with a low level of UV radiation or a relatively dark-skinned population. If left untreated, AK can develop into SCC.

 Melanoma and nonmelanoma skin cancers are among the most common types
15 of cancer in Caucasian populations. Many epidemiological studies have demonstrated that the incidence of skin cancer has been increasing rapidly over the last decades.

 Malignant melanoma is the most aggressive and life-threatening skin cancer. It develops in melanocytes - cells of the basal germinative cell layer of the epidermis that give the skin its color - and often spreads to other parts of the body. Incidence
20 of malignant melanoma is closely associated with skin color and geography. Incidence among dark-skinned populations is about 1 per 100,000 population per year or less, but can be more than 50-fold greater among light-skinned populations in some areas of the world. The highest incidence rates have been reported in Queensland, Australia, with 56 new cases per 100,000 population per year for men and 43 new cases per 100,000
25 population per year for women. In the United States, incidence of melanoma has been estimated to be 14 new cases per year per 100,000 Caucasian men, and about 11 new cases per year per 100,000 Caucasian women.

 Sun exposure, i.e., exposure to solar UV radiation, has been reported to be a general risk factor for melanoma. A more specific risk factor for melanoma is sun
30 exposure during childhood, especially when the childhood history of exposure to solar UV radiation includes frequent or severe sunburn.

 An additional risk factor for melanoma is skin type. Skin type I or II - skin that burns easily or severely and tans minimally or not at all - and the presence of multiple

moles are important melanoma-related risk factors. Also, skin that is infrequently or only intermittently exposed to the sun (e.g., the skin of those who work indoors) may have a higher tendency to develop melanoma when intensely exposed to UV radiation than skin that is more regularly exposed to sunlight (e.g., the skin of those who work or are often outdoors).

Nonmelanoma skin cancers (NMSCs) constitute more than one-third of all cancers in the United States with an estimated incidence of over 600,000 cases per year. NMSCs are the most common malignancies occurring in the Caucasian population each year. Of these, most are basal cell carcinomas (BCCs) and squamous cell carcinomas (SCCs).

BCC represents 75% of NMSC and is the most common malignant disease throughout the world. There is an increased risk of NMSC in Caucasian populations, especially those who have blue eyes, a fair complexion, sunburn easily, suntan poorly, freckle with sun exposure, and/or have red, blond, or light-brown hair. NMSC is uncommon in blacks, Asians, and Hispanics. The incidence of NMSC is increasing rapidly in Caucasian populations of Europe, the United States, Canada, and Australia.

Chronic exposure to solar UV radiation is considered to be an important contributing factor to the development of NMSC. Over 80% of NMSCs occur on areas of the body that are frequently exposed to sunlight, such as the head, the neck, and the back of the hands. Additionally, BCC is also commonly found on the nose. The incidence of NMSC is elevated in individuals with a high cumulative exposure to UV light, such as those who work outdoors and those who more frequently participate in outdoor activities.

BCC is the most common skin cancer in humans. It often occurs on sun-exposed areas of the skin. It develops in the basal germinative cell layer of the epidermis. BCC can be very destructive and disfiguring, but rarely spread to other parts of the body.

SCC is a skin cancer arising from cells of the epidermis - the top layer of the skin - and can spread to other parts of the body. Squamous cell carcinoma occurs when abnormal cells - keratinocytes - of the epidermis migrate to and invade the underlying dermis.

Summary

It has been found that certain small molecule IRMs can be used as a prophylactic treatment for providing protection against epidermal neoplasia such as, for example, actinic keratosis, pre-actinic keratosis lesions, malignant melanoma, and NMSCs such as, for example, basal cell carcinoma, and squamous cell carcinoma.

Accordingly, the present invention provides a method of protecting a subject against UV-induced epidermal neoplasia. Generally, the method includes administering to a subject an IRM compound in an amount effective to provide protection against UV-induced epidermal neoplasia.

In some embodiments, the IRM compound may be administered to the subject in a dose of from about 10 µg/kg to about 5 mg/kg.

In some embodiments, the IRM compound may be administered intermittently, for example, at least once per month, at least once per week, or at least twice per week. Also, in various embodiments, the treatment can begin before, simultaneously with, or after, UV exposure.

In some embodiments, the method provides protection against melanoma, basal cell carcinoma, squamous cell carcinoma, actinic keratosis, or pre-actinic keratosis lesions.

In some embodiments, the IRM compound is administered in a topical formulation. In certain embodiments, the formulation includes from about 0.01% to about 10% IRM compound, by weight. In certain embodiments, the topical formulation can be a cream, an ointment, an aerosol formulation, a non-aerosol spray, a gel, or a lotion. In some embodiments, the topical formulation may include at least one sunscreen agent.

Various other features and advantages of the present invention should become readily apparent with reference to the following detailed description, examples, and claims. In several places throughout the specification, guidance is provided through lists of examples. In each instance, the recited list serves only as a representative group and should not be interpreted as an exclusive list.

Detailed Description of Illustrative Embodiments of the Invention

The present invention provides a method of protecting a subject from UV-induced epidermal neoplasia by prophylactically treating the skin of the subject with an

IRM compound. The present invention also provides compositions that include an IRM compound in an amount effective to provide protection against UV-induced epidermal neoplasia.

5 Epidermal neoplasia such as, for example, actinic keratosis, pre-actinic keratosis lesions, malignant melanoma, basal cell carcinoma, and squamous cell carcinoma, often can be the result of damage induced by exposure of the skin to UV solar radiation. Currently, protection from UV-induced skin damage is provided by the topical application of sunscreens that block or screen the skin from at least a portion of the solar UV radiation spectrum. Typically, a sunscreen provides only temporary protection, it
10 must be reapplied each time protection is sought and can provide protection only while applied to a subject. Thus, protection from UV radiation offered by sunscreens may be prematurely and/or unknowingly limited if the sunscreen is removed such as by, for example, contact with another surface, water, or perspiration.

15 Certain small molecule IRMs, however, can be used as a prophylactic treatment that can protect a subject against epidermal neoplasia. In contrast to the protection offered by sunscreens, protection from UV-induced epidermal neoplasia provided by certain IRM compounds can be observed when the compound is administered before or, after the subject is exposed to UV radiation. Protection also can be observed from intermittent - less than once per day - administration even when UV exposure occurs
20 daily. Thus, in contrast to sunscreens, certain IRM compounds can provide protection against UV-induced epidermal neoplasia even on days when the IRM compound is not administered. Finally, and again in contrast to sunscreens, certain IRM compounds can continue to provide protection against epidermal neoplasia even after the compound is removed from the treatment site. Thus, the present invention provides an alternative
25 option for prophylactic treatment against UV-induced skin damage for those who, for example, experience chronic sun exposure but cannot always conveniently apply or reapply sunscreen.

30 As used herein, "protect" and variations thereof refer to any measurable reduction in the likelihood, occurrence, and/or severity (e.g., number and/or size) of epidermal neoplastic lesions.

 The method of the invention may be employed to decrease the likelihood, occurrence, and/or severity of epidermal neoplasia in a subject that has not yet exhibited clinical evidence of a condition for which epidermal neoplasia is a symptom

(e.g., BCC, SCC, melanoma, etc.). Thus, in some embodiments, the method may protect a subject from a first instance of epidermal neoplasia. In other embodiments, the method may protect a subject from the growth or spread of subclinical epidermal neoplastic lesions.

5 Alternatively, the method may be employed to decrease the likelihood and/or severity of epidermal neoplasia recurrence in a subject that has received treatment for clinically evident epidermal neoplasia. As used herein, "recurrence" and variations thereof refer to reappearance of epidermal neoplasia after apparent clearance of treated epidermal neoplastic lesions, without regard to the underlying mechanism of the
10 recurrence (i.e., whether recurrence occurs because, for example, the initial lesions were incompletely cleared, or the subject possesses one or more genetic or environmental risk factors for developing epidermal neoplasia) or the manner in which initial epidermal neoplastic lesions were treated (e.g., surgery, chemotherapy, immunotherapy, etc.). Thus, in some embodiments, the method may be used to protect
15 a subject from recurring instances of epidermal neoplasia.

 Immune response modifier compounds ("IRMs") include compounds that possess potent immunomodulating activity including but not limited to antiviral and antitumor activity. Certain IRMs modulate the production and secretion of cytokines. For example, certain IRM compounds induce the production and secretion of cytokines
20 such as, e.g., Type I interferons, TNF- α , IL-1, IL-6, IL-8, IL-10, IL-12, MIP-1, and/or MCP-1. As another example, certain IRM compounds can inhibit production and secretion of certain T_H2 cytokines, such as IL-4 and IL-5. Additionally, some IRM compounds are said to suppress IL-1 and TNF (U.S. Patent No. 6,518,265).

 Certain IRMs are small organic molecules (e.g., molecular weight under about
25 1000 Daltons, preferably under about 500 Daltons, as opposed to large biological molecules such as proteins, peptides, and the like) such as those disclosed in, for example, U.S. Patent Nos. 4,689,338; 4,929,624; 4,988,815; 5,037,986; 5,175,296; 5,238,944; 5,266,575; 5,268,376; 5,346,905; 5,352,784; 5,367,076; 5,389,640; 5,395,937; 5,446,153; 5,482,936; 5,693,811; 5,741,908; 5,756,747; 5,939,090;
30 6,039,969; 6,083,505; 6,110,929; 6,194,425; 6,245,776; 6,331,539; 6,376,669; 6,451,810; 6,525,064; 6,541,485; 6,545,016; 6,545,017; 6,558,951; 6,573,273; 6,656,938; 6,660,735; 6,660,747; 6,664,260; 6,664,264; 6,664,265; 6,667,312; 6,670,372; 6,677,347; 6,677,348; 6,677,349; 6,683,088; European Patent 0 394 026;

U.S. Patent Publication Nos. 2002/0016332; 2002/0055517; 2002/0110840; 2003/0133913; 2003/0199538; and 2004/0014779; and International Patent Publication Nos. WO 01/74343; WO 02/46749 WO 02/102377; WO 03/020889; WO 03/043572; WO 03/045391; and WO 03/103584.

5 Additional examples of small molecule IRMs include certain purine derivatives (such as those described in U.S. Patent Nos. 6,376,501, and 6,028,076), certain imidazoquinoline amide derivatives (such as those described in U.S. Patent No. 6,069,149), certain imidazopyridine derivatives (such as those described in U.S. Patent No. 6,518,265), certain benzimidazole derivatives (such as those described in U.S. Patent 6,387,938), certain derivatives of a 4-aminopyrimidine fused to a five membered
10 nitrogen containing heterocyclic ring (such as adenine derivatives described in U. S. Patent Nos. 6,376,501; 6,028,076 and 6,329,381; and in WO 02/08595), and certain 3- β -D-ribofuranosylthiazolo[4,5-d]pyrimidine derivatives (such as those described in U.S. Publication No. 2003/0199461).

15 Other IRMs include large biological molecules such as oligonucleotide sequences. Some IRM oligonucleotide sequences contain cytosine-guanine dinucleotides (CpG) and are described, for example, in U.S. Patent Nos. 6,194,388; 6,207,646; 6,239,116; 6,339,068; and 6,406,705. Some CpG-containing oligonucleotides can include synthetic immunomodulatory structural motifs such as
20 those described, for example, in U.S. Patent Nos. 6,426,334 and 6,476,000. Other IRM nucleotide sequences lack CpG and are described, for example, in International Patent Publication No. WO 00/75304.

Other IRMs include biological molecules such as aminoalkyl glucosaminide phosphates (AGPs) and are described, for example, in U.S. Patent Nos. 6,113,918;
25 6,303,347; 6,525,028; and 6,649,172.

IRM compounds suitable for use in the invention include compounds having a 2-aminopyridine fused to a five membered nitrogen-containing heterocyclic ring. Such compounds include, for example, imidazoquinoline amines including but not limited to substituted imidazoquinoline amines such as, for example, amide substituted
30 imidazoquinoline amines, sulfonamide substituted imidazoquinoline amines, urea substituted imidazoquinoline amines, aryl ether substituted imidazoquinoline amines, heterocyclic ether substituted imidazoquinoline amines, amido ether substituted imidazoquinoline amines, sulfonamido ether substituted imidazoquinoline amines, urea

substituted imidazoquinoline ethers, thioether substituted imidazoquinoline amines, and 6-, 7-, 8-, or 9-aryl or heteroaryl substituted imidazoquinoline amines; tetrahydroimidazoquinoline amines including but not limited to amide substituted tetrahydroimidazoquinoline amines, sulfonamide substituted tetrahydroimidazoquinoline amines, urea substituted tetrahydroimidazoquinoline amines, aryl ether substituted tetrahydroimidazoquinoline amines, heterocyclic ether substituted tetrahydroimidazoquinoline amines, amido ether substituted tetrahydroimidazoquinoline amines, sulfonamido ether substituted tetrahydroimidazoquinoline amines, urea substituted tetrahydroimidazoquinoline ethers, and thioether substituted tetrahydroimidazoquinoline amines; imidazopyridine amines including but not limited to amide substituted imidazopyridine amines, sulfonamide substituted imidazopyridine amines, urea substituted imidazopyridine amines, aryl ether substituted imidazopyridine amines, heterocyclic ether substituted imidazopyridine amines, amido ether substituted imidazopyridine amines, sulfonamido ether substituted imidazopyridine amines, urea substituted imidazopyridine ethers, and thioether substituted imidazopyridine amines; 1,2-bridged imidazoquinoline amines; 6,7-fused cycloalkylimidazopyridine amines; imidazonaphthyridine amines; tetrahydroimidazonaphthyridine amines; oxazoloquinoline amines; thiazoloquinoline amines; oxazolopyridine amines; thiazolopyridine amines; oxazolonaphthyridine amines; thiazolonaphthyridine amines; imidazoquinoline-1,4-diamines; and 1*H*-imidazo dimers fused to pyridine amines, quinoline amines, tetrahydroquinoline amines, naphthyridine amines, or tetrahydronaphthyridine amines.

In one embodiment, the IRM may be an imidazoquinoline amine such as, for example, 1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine or 4-amino- α,α -dimethyl-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-ethanol.

In certain embodiments, the IRM compound may be an imidazonaphthyridine amine, a tetrahydroimidazonaphthyridine amine, an oxazoloquinoline amine, a thiazoloquinoline amine, an oxazolopyridine amine, a thiazolopyridine amine, an oxazolonaphthyridine amine, or a thiazolonaphthyridine amine.

In certain embodiments, the IRM compound may be a substituted imidazoquinoline amine, a tetrahydroimidazoquinoline amine, an imidazopyridine amine, a 1,2-bridged imidazoquinoline amine, a 6,7-fused cycloalkylimidazopyridine amine, an imidazonaphthyridine amine, a tetrahydroimidazonaphthyridine amine, an

oxazoloquinoline amine, a thiazoloquinoline amine, an oxazolopyridine amine, a thiazolopyridine amine, an oxazolonaphthyridine amine, or a thiazolonaphthyridine amine.

As used herein, a substituted imidazoquinoline amine refers to an amide substituted imidazoquinoline amine, a sulfonamide substituted imidazoquinoline amine, a urea substituted imidazoquinoline amine, an aryl ether substituted imidazoquinoline amine, a heterocyclic ether substituted imidazoquinoline amine, an amido ether substituted imidazoquinoline amine, a sulfonamido ether substituted imidazoquinoline amine, a urea substituted imidazoquinoline ether, a thioether substituted imidazoquinoline amines, or a 6-, 7-, 8-, or 9-aryl or heteroaryl substituted imidazoquinoline amine. As used herein, substituted imidazoquinoline amines specifically and expressly exclude 1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine and 4-amino- α,α -dimethyl-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-ethanol.

In some embodiments, suitable IRM compounds also may include the purine derivatives, small heterocyclic compounds, amide derivatives, and oligonucleotide sequences described above. In some embodiments, the IRM compound may be a compound identified as an agonist of one or more Toll-like receptors (TLRs). Certain small molecule IRM compounds have been identified as agonists of one or more of TLR6, TLR7, and TLR8. Certain oligonucleotide IRM compounds have been identified as agonists of TLR9.

In one particular embodiment, the IRM compound is an imidazonaphthyridine amine such as, for example, 1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*] [1,5]naphthyridin-4-amine or 2-methyl-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*] [1,5]naphthyridin-4-amine.

In an alternative embodiment, the IRM compound is a 1,2-bridged imidazoquinoline amine such as, for example, 8,9,10,11-tetrahydropyrido[1',2':1,2]imidazo[4,5-*c*]quinolin-6-amine.

In another alternative embodiment, the IRM compound is an amide substituted imidazoquinoline amine such as, for example, N-{2-[4-amino-2-(ethoxymethyl)-1*H*-imidazo[4,5-*c*]quinolin-1-yl]-1,1-dimethylethyl}cyclohexanecarboxamide or N-[4-(4-amino-2-ethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl]-2-methylpropanamide.

In another alternative embodiment, the IRM compound is a sulfonamide substituted imidazoquinoline amine such as, for example, N-[2-(4-amino-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide.

5 In another alternative embodiment, the IRM compound is a sulfonamide substituted tetrahydroimidazoquinoline amine such as, for example, N-{2-[4-amino-2-(2-methoxyethyl)-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-1-yl]-1,1-dimethylethyl}methanesulfonamide.

10 In another alternative embodiment, the IRM compound is a urea substituted imidazoquinoline amine such as, for example, N-[4-(4-amino-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl]-N'-isopropylurea.

In another alternative embodiment, the IRM compound is an imidazopyridine amine such as, for example, N-{2-[4-amino-2-(ethoxymethyl)-6,7-dimethyl-1*H*-imidazo[4,5-*c*]pyridin-1-yl]-1,1-dimethylethyl}-N'-cyclohexylurea.

15 In another alternative embodiment, the IRM compound is a heterocyclic ether substituted imidazoquinoline amine such as, for example, 1-{2-[3-(3-pyridyl)propoxy]ethyl}-1*H*-imidazo[4,5-*c*]quinolin-4-amine.

20 In another alternative embodiment, the IRM compound is a thioether substituted imidazoquinoline amine such as, for example, 2-butyl-1-[3-(methylsulfonyl)propyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine or 2-butyl-1-[2-(propylsulfonyl)ethyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine.

In yet another alternative embodiment, the IRM compound is an imidazoquinoline-1,4-diamine such as, for example, 2-ethoxymethyl-N¹-isopropyl-1*H*-imidazo[4,5-*c*]quinoline-1,4-diamine.

25 Unless otherwise indicated, reference to a compound can include the compound in any pharmaceutically acceptable form, including any isomer (e.g., diastereomer or enantiomer), salt, solvate, polymorph, and the like. In particular, if a compound is optically active, reference to the compound can include each of the compound's enantiomers as well as racemic mixtures of the enantiomers.

30 The IRM compound may be provided in a formulation suitable for topical administration. Suitable types of formulations are described, for example, in International Patent Publication No. WO 03/045391. The IRM compound may be provided in any suitable form including but not limited to a solution, a suspension, an emulsion, or any form of mixture. The IRM may be delivered in formulation with any

pharmaceutically acceptable excipient, carrier, or vehicle. The formulation may be delivered in any conventional topical dosage form such as, for example, a cream, an ointment, an aerosol formulation, a non-aerosol spray, a gel, a lotion, and the like. The formulation may further include one or more additives including but not limited to

5 adjuvants, skin penetration enhancers, colorants, fragrances, moisturizers, thickeners, and the like. In some embodiments, the IRM compound may be provided in a formulation with one or more sunscreen agents.

Sunscreen agents can include agents that block at least a portion of UVB and/or UVA solar radiation. Some sunscreen agents may preferentially block UVB radiation.

10 Other sunscreen agents may preferentially block UVB radiation. Still other sunscreen agents may block UVA and UVB radiation. Suitable sunscreen agents include, for example, aminobenzoic acid, p-aminobenzoic acid (PABA), padimate O, homosalate, octyl methoxycinnamate, benzophenone, octyl salicylate, trolamine salicylate, phenylbenzimidazole, sulisobenzene, aminobenzoic acid, sulfonic acid, octocrylene,

15 oxybenzone, dioxymethylene, avobenzone, titanium dioxide, zinc oxide, lisadimate, roxadimate, menthyl anthranilate, benzoate-4 methylbenzylidene camphor, and mexoryl SX.

In some embodiments, the methods of the present invention include administering an IRM compound to a subject in a formulation of, for example, from

20 about 0.0001% to about 10% (unless otherwise indicated, all percentages provided herein are weight/weight with respect to the total formulation) to the subject, although in some embodiments the IRM compound may be administered using a formulation that provides IRM compound in a concentration outside of this range. In certain embodiments, the method includes administering to a subject a formulation that

25 includes from about 0.01% to about 1% IRM compound, for example, a formulation that includes about 0.1% IRM compound.

An amount of an IRM compound effective for providing protection against UV-induced epidermal neoplasia is an amount sufficient to reduce the size, the frequency of occurrence, or both, of UV-induced epidermal neoplasia in a subject or a portion of a

30 subject. The precise amount of IRM compound for providing protection against UV-induced neoplasia will vary according to factors known in the art including but not limited to the physical and chemical nature of the IRM compound, the formulation in which the IRM compound is provided, the nature of the carrier, the intended dosing

regimen, the state of the subject's immune system (e.g., suppressed, compromised, stimulated), the method of administering the IRM compound, and the species to which the formulation is being administered. Accordingly it is not practical to set forth generally the amount that constitutes an amount of IRM compound effective to provide protection against UV-induced epidermal neoplasia for all possible applications. Those of ordinary skill in the art, however, can readily determine the appropriate amount with due consideration of such factors.

The precise amount of IRM compound will vary according to factors known in the art. In some embodiments, an amount of IRM compound effective for providing protection against UV-induced epidermal neoplasia is an amount sufficient to provide a dose of about 100 ng/kg to about 50 mg/kg, although in some embodiments an effective amount of IRM compound may be provided in a dose outside this range. In certain embodiments, an amount of IRM compound effective for providing protection against UV-induced epidermal neoplasia may be an amount of IRM compound that provides a dose of from about 10 µg/kg to about 5 mg/kg, for example, from about 100 µg/kg to about 1 mg/kg.

The dosing regimen may depend at least in part on many factors known in the art including but not limited to the physical and chemical nature of the IRM compound, the nature of the carrier, the amount of IRM being administered, the state of the subject's immune system (e.g., suppressed, compromised, stimulated), the frequency, duration, and/or intensity of UV exposure, the method of administering the IRM compound, and the species to which the formulation is being administered. Accordingly it is not practical to set forth generally the dosing regimen effective to provide protection against UV-induced epidermal neoplasia for all possible applications. Those of ordinary skill in the art, however, can readily determine the appropriate amount with due consideration of such factors.

More frequent administration of the IRM compound, even if at lower doses, may provide more continuous (i.e., uninterrupted) protection against UV-induced epidermal neoplasia. Such dosing regimens may be desirable, for example, for subjects at high risk of developing epidermal neoplasia. Such dosing regimens also may be desirable, for example, for those in geographic locations having sustained and/or intense exposure to UV radiation.

Less frequent administration may provide less continuous (i.e., interrupted) protection against UV-induced epidermal neoplasia. Such dosing regimens may be sufficient for those, for example, in geographic locations (e.g., higher latitudes) that experience periods of decreased solar UV radiation intensity.

5 In some embodiments of the invention, the IRM compound may be administered, for example, from about twice per day to about once per month, although in some embodiments the methods of the present invention may be performed by administering the IRM compound at a frequency outside this range. In addition, the IRM compound may be administered on a regular, recurring, or scheduled basis.

10 Alternatively, the IRM compound may be administered on an irregular schedule – i.e., at varying intervals such as, for example, when exposure to UV radiation is expected and/or has already occurred.

In certain embodiments, the IRM compound may be administered from about once per week to about seven times per week. In one particular embodiment, the IRM

15 compound is administered twice per week. Treatment methods according to the present invention may be initiated after, concurrent with, or before exposure to UV radiation.

In one particular embodiment, a formulation that includes an IRM compound may be administered to one at risk for developing epidermal neoplasia. Such individuals may possess one or more risk factors such as, for example, previously

20 diagnosis of and/or treatment for epidermal neoplasia, age, present extent (e.g., frequency, duration, and/or intensity) of UV exposure, childhood history of UV exposure, sunburn history, skin type, possessing multiple moles, hair color, eye color, etc. Treatment may involve all or a portion of sun-exposed areas of the skin. For example, treatment may be limited to areas of relatively high UV exposure such as, for

25 example, the scalp, face (including e.g., the ears and nose), neck, arms, legs, and hands. In some cases, the IRM compound may be applied to an area that has previously received treatment for prior epidermal neoplasia such as, for example, a skin graft or other site from which a neoplastic lesion has been removed.

In another particular embodiment, the IRM compound may be provided as an

30 additive to a conventional skincare product such as, for example, sunscreen, moisturizing lotion, or cosmetic (e.g., a face cream or make-up). Consequently, the IRM compound may be administered when a subject applies the skincare product. In

such cases, the dosing regimen may be subject to the schedule of use for the skincare product.

In the case in which the IRM compound is an additive to a sunscreen product, the IRM compound may provide protection against epidermal neoplasia induced by exposure to UV radiation that occurs over a greater period of time than can be protected against by the sunscreen alone. For example, the IRM compound may provide protection against epidermal neoplasia induced by exposure to UV radiation that occurred prior to application of the sunscreen/IRM product or occurs after the sunscreen/IRM product is removed from the skin (e.g., by washing, perspiration, etc.).

In the case in which the IRM compound is an additive to, for example, a moisturizing lotion or cosmetic, the IRM compound may be administered more frequently. Consequently, a lower dose of IRM may be sufficient to provide protection against UV-induced epidermal neoplasia.

The methods of the present invention may be performed on any suitable subject. Suitable subjects include but are not limited to animals such as but not limited to humans, non-human primates, rodents, dogs, cats, horses, pigs, sheep, goats, or cows.

Examples

The following examples have been selected merely to further illustrate features, advantages, and other details of the invention. It is to be expressly understood, however, that while the examples serve this purpose, the particular materials and amounts used as well as other conditions and details are not to be construed in a matter that would unduly limit the scope of this invention.

IRM Compounds

The IRM compounds used in the examples are shown in Table 1.

Table 1

<u>Compound</u>	<u>Chemical Name</u>	<u>Reference</u>
IRM1	1-(2-methylpropyl)-1 <i>H</i> -imidazo[4,5- <i>c</i>][1,5]naphthyridin-4-amine	U.S. 6,194,425 Example 32
IRM2	2-methyl-1-(2-methylpropyl)-1 <i>H</i> -imidazo[4,5- <i>c</i>][1,5]naphthyridin-4-amine	U.S. 6,194,425 Example 36
IRM3	8,9,10,11-tetrahydropyrido[1',2':1,2]imidazo[4,5- <i>c</i>]quinolin-6-amine	U.S. 5,482,936 Example 1

<u>Compound</u>	<u>Chemical Name</u>	<u>Reference</u>
IRM4	N-{2-[4-amino-2-(ethoxymethyl)-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-1-yl]-1,1-dimethylethyl}cyclohexanecarboxamide	U.S. 2003/0144283 [#]
IRM5	N-[4-(4-amino-2-ethyl-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-1-yl)butyl]-2-methylpropanamide	U.S. 2003/0144283 Example 199
IRM6	N-[2-(4-amino-2-propyl-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide	U.S. 6,677,349 [#]
IRM7	N-{2-[4-amino-2-(2-methoxyethyl)-6,7,8,9-tetrahydro-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-1-yl]-1,1-dimethylethyl}methanesulfonamide	U.S. 6,331,539 [#]
IRM8	N-[4-(4-amino-2-propyl-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-1-yl)butyl]- <i>N</i> '-isopropylurea	U.S. 6,541,485 [#]
IRM9	N-{2-[4-amino-2-(ethoxymethyl)-6,7-dimethyl-1 <i>H</i> -imidazo[4,5- <i>c</i>]pyridin-1-yl]-1,1-dimethylethyl}- <i>N</i> '-cyclohexylurea	U.S. 6,545,017 [#]
IRM10	1-{2-[3-(3-pyridyl)propoxy]ethyl}-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-4-amine	WO 02/46193 Example 33
IRM11	2-butyl-1-[3-(methylsulfonyl)propyl]-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-4-amine	U.S. 6,664,264 Example 19
IRM12	2-butyl-1-[2-(propylsulfonyl)ethyl]-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-4-amine	U.S. 6,667,312 Example 62
IRM13	2-ethoxymethyl- <i>N</i> ¹ -isopropyl-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinoline-1,4-diamine	U.S. Ser. No. 60/453128 Example 5
IRM14	1-(2-methylpropyl)-1 <i>H</i> -imidazo[4,5- <i>c</i>]quinolin-4-amine	U.S. 4,689,338 Example 99

Topical Formulations

Unless otherwise noted, the formulation of the vehicles used in the following examples, on a percentage weight-by-weight basis, is provided in Table 2.

5

Table 2

<u>Materials</u>	<u>Vehicle 1</u>	<u>Vehicle 2</u>
Isopropyl Myristate, NF	10.00	
PRIPURE (Uniqema, New Castle, DE)		10.00
Isostearic Acid	5.00	5.00
PLURONIC F68, NF (BASF Corp., Mount Olive, NJ)	2.5	2.5
Disodium EDTA, USP	0.05	0.05
CARBOMER 974 (CarboMer, Inc., San Diego, CA)	1.00	
CARBOMER 980 (CarboMer, Inc.)		0.7
Propylene glycol, USP	15.00	

Materials	Vehicle 1	Vehicle 2
Diethylene Glycol Monoethyl Ether, USP		10.00
Propylparaben, NF	0.1	
Ethylparaben, NF		0.2
Methylparaben, NF	0.2	0.2
Purified water, USP	65.65	70.95
20% w/w NaOH	0.5	0.4

Formulations containing IRM compound were prepared by adding the appropriate amount of IRM compound, on a percentage weight-by-weight basis, to the vehicle to obtain the final IRM weight percentage, and decreasing the amount of water added accordingly.

The formulation was prepared as follows:

Oil phase preparation: IRM compound, when present, was dissolved in isostearic acid and either isopropyl myristate or PRIPURE, with heat if necessary. CARBOMER 974 or CARBOMER 980, as indicated, was then dispersed in the oil phase.

Water phase preparation: Disodium EDTA was dissolved in the water. Methylparaben and either propylparaben or ethylparaben, as indicated, were dissolved in either propylene glycol or diethylene glycol monoethyl ether, as indicated, and the solution was subsequently added to the water phase. PLURONIC F68 was then added to the water phase and mixed until dissolved.

Phase combination: The oil phase was added to the water phase at ambient conditions. The emulsion was then homogenized. After homogenization, sodium hydroxide solution (20% w/w) was added and the resulting cream was mixed until smooth and uniform. The pH of the cream was measured and a pH adjustment was made with additional sodium hydroxide solution, if necessary, to meet the in-process target pH of 5.0.

Animal Model:

Female SKH-1 mice 9-10 weeks old were obtained from Charles River (Raleigh, NC) and housed in a room with controlled temperatures and humidity and alternating 12-hour light and dark cycles. The room is lit with fluorescent lights covered by yellow sleeves from EncapSulite International, Inc. (Rosenberg, TX) to eliminate all ambient UV radiation. The mice were fed with a 12% Corn Oil Purified

Diet from Purina Test Diet (Richmond, VA) and water, *ad libitum*. The animals were maintained in facilities approved by the Association for the Assessment and Accreditation of Laboratory Animal Care International and in accordance with current United States Department of Agriculture, Department of Health and Human Services, and National Institutes of Health regulations and standards.

A small group of mice were not exposed to UV and were used as negative controls. The other mice were chronically UV irradiated. After randomization the mice were lightly anesthetized with halothane and adjustable collars made of hook and loop fastener approximately 10 mm wide and 70 mm long were placed around the mouse's neck to prevent oral ingestion of the IRM. Unless otherwise indicated, thirty minutes before UV exposure mice were topically dosed with 30 μ L of either (1) vehicle formulation, (2) IRM formulation, or (3) an SPF 30 sunscreen (NEUTROGENA SPF30 Sunblock with PARSOL 1789), two times per week for a total of 15-18 weeks on the dorsal surface in an area approximately 6 cm². Approximately four hours after dosing, the topical treatment (i.e., vehicle formulation, IRM formulation, or sunscreen) was washed off using a dilute soap solution.

Mice were placed in a standard plexiglass rat cage, 9-10 at a time, that was separated into 12 individual compartments with plexiglass dividers and placed on a shelf 14 inches below the light source without wire cage tops. The mice were exposed to UV radiation 5 times per week (Monday thru Friday) for an average of 15-18 weeks. The UV radiation was provided by a bank of six FS40 lamps (National Biological Corporation, Twinsburg, OH), filtered by a Kodacel filter (140 μ m thick K6808 cellulose triacetate film; Eastman Kodak, Rochester, NY) that transmits radiation having a wavelength from about 293 nm to about 400 nm. The Kodacel filter was aged 4-6 hours before use. The lights emit UVB (21%) and UVA (79%) light with a peak wavelength of 313 nm, as measured using a radiometer Model PMA 2200 from Solar Light Company (Philadelphia, PA) with a PMA 2101 detector for UVB and PMA2110 detector for UVA.

The dose of UVB irradiation was measured by MED (minimal erythema dose). By using MED, a relatively constant incident dose of UV was maintained over time. The initial dose of UVB to the mice was 12.6 mJ/cm² (0.6 MED) and the average total dose of UVB was 3000 - 5200 mJ/cm². An increase of 10-20% of the MED dose per week was needed due to acclimation of the mice.

All mice were distinguished from one another by a tattoo placed on the tail. The development and appearance of tumors were noted weekly and recorded starting at about 14-18 weeks.

5 Example 1

IRM1 and IRM2 formulations were prepared using Vehicle 1. UV dosing and IRM dosing were initiated simultaneously. UV dosing was performed five days per week for 15 weeks. Topical dosing (IRM or vehicle) was performed twice per week at the doses indicated in Table 3.

10 After 15 weeks, the mice were subjected to gross inspection to determine the presence of a disease state, i.e., squamous cell carcinoma (SCC), actinic keratosis (AK), or pre-AK lesions. Results are shown in Table 3 and are expressed as the percentage of mice exhibiting a disease state: % Disease = $\frac{(\text{SCC} + \text{AK} + \text{pre-AK lesion})}{\text{Total mice}}$

Total mice

15

Table 3

<u>Treatment</u>	<u>No. of mice</u>	<u>% Disease</u>
UV Exposed - vehicle	10	70
UV Exposed - 0.1% IRM1	10	0
UV Exposed - 0.1% IRM2	9	11
No UV exposure	5	0

Example 2

20 A 0.1 % formulation of IRM2 was prepared using Vehicle 1. A 1.0% formulation of IRM2 was prepared using Vehicle 1, except that the isostearic acid was increased to 13.0 % (w/w), the NaOH was decreased to 0.5 % (w/w), and the water was adjusted accordingly. Vehicle 2 was used as the placebo cream. UV dosing was performed for six weeks before IRM dosing was initiated. UV dosing was performed five days per week for 15 weeks. Topical dosing (IRM, vehicle, or sunscreen) was performed twice per week at the doses indicated in Table 4.

25

After 15 weeks, the mice were subjected to gross inspection to determine the presence of a disease state, i.e., squamous cell carcinoma (SCC), actinic keratosis (AK), or pre-AK lesions. Results are shown in Table 4.

Table 4

<u>Treatment</u>	<u>No. of mice</u>	<u>% Disease</u>
UV Exposed - 0.1% IRM2	8	63
UV Exposed - 1.0% IRM2	6	50
UV Exposed - SPF 30 sunscreen	8	63
UV Exposed – vehicle	8	75
No UV exposure	5	0

Example 3

5 Formulations of IRM1 and IRM2 were prepared using Vehicle 1. UV dosing and IRM dosing were initiated simultaneously. UV dosing was performed five days per week for 18 weeks. Topical dosing (IRM, vehicle, or sunscreen) was performed twice per week at the doses indicated in Table 6.

10 After 18 weeks, the mice were subjected to gross inspection to determine the presence of a disease state, i.e., squamous cell carcinoma (SCC), actinic keratosis (AK), or pre-AK lesions. Results are shown in Table 6.

15 The disease state of each mouse was scored by measuring the size and/or number of lesions present on the mouse. SCC lesions and AK lesions of at least 1 mm in diameter were given a score of 1. Pre-AK lesions of less than 1 mm were scored as indicated in Table 5.

Table 5 - Scoring of UV-induced lesions less than 1 mm in diameter

<u>Lesion Frequency</u>	<u>Score</u>
Rare (0-1)	0
Few (2-10)	0.5
Moderate (11-20)	1.0
Many (>21)	1.5

20 The SCC lesion score, AK lesion score, and the pre-AK lesion score (according to Table 5) were added to provide a total disease score for each mouse. Table 6 includes the average disease score for all of the mice in each treatment group.

Table 6

<u>Treatment</u>	<u>No. of Mice</u>	<u>% Disease</u>	<u>Avg. Disease Score</u>
UV Exposed - 0.1% IRM 2	8	25	0.6 ± 0.42
UV Exposed - 0.01% IRM 2	7	71	4.86 ± 1.81
UV Exposed - 0.1% IRM 1	6	50	0.66 ± 0.33
UV Exposed - 0.01% IRM 1	7	71	2.86 ± 0.82
UV Exposed - SPF 30 sunscreen	5	40	0.6 ± 0.4
UV Exposed - vehicle	8	75	1.75 ± 0.53
No UV exposure	5	0	0

Example 4

IRM compounds were formulated as shown in Table 7. UV dosing and IRM dosing were initiated simultaneously. Daily UV dosing was performed five days per week for 17 weeks. IRM dosing was performed twice per week with the compounds indicated in Table 9, each in a 0.1 % formulation. SPF dosing was performed five times per week.

Table 7

<u>Materials</u>	<u>w/w%</u>
IRM compound	0.10
CRODAMOL GTCC-PN (Croda, Inc., Parsippany, NJ)	10.00
Isostearic Acid	5.00
PLURONIC F68, NF (BASF Corp., Mount Olive, NJ)	2.5
Disodium EDTA, USP	0.05
CARBOPOL 980 (Noveon, Inc., Cleveland, OH)	0.7
TRANSCUTOL P (Gattefossé Corp., Paramus, NJ)	10.00
Ethylparaben, NF	0.2
Methylparaben, NF	0.2
Purified water, USP	70.85
20% w/w NaOH	0.4

An additional group of mice were topically dosed twice per week with 0.1% formulation of a non-IRM control compound: 1,5-dihydro-1-(2-methylpropyl)-4H-imidazo[4,5-c]quinolin-4-one, the synthesis of which is described in U.S. Pat. No. 4,698,348, Example 71, formulated as shown in Table 8. The non-IRM compound is structurally related to, but outside the scope of, IRM compounds as provided above. In

contrast to IRM compounds, the non-IRM compound does not induce the production and secretion of cytokines. Mice in the non-IRM group were UV dosed five times per week for 18 weeks.

5

Table 8

Materials	w/w%
Non-IRM compound	0.1
PRIPURE (Unigema, New Castle, DE)	10.00
Isostearic Acid	5.00
TRANSCUTOL P (Gattefossé Corp., Paramus, NJ)	10.00
PLURONIC F68, NF (BASF Corp., Mount Olive, NJ)	2.5
Disodium EDTA, USP	0.05
CARBOPOL 980, NF	0.7
Ethylparaben, NF	0.2
Methylparaben, NF	0.2
Purified water, USP	70.85
20% w/w NaOH	0.4

After the course of treatment and UV dosing, the mice were subjected to gross inspection to determine the presence of a disease state, i.e., squamous cell carcinoma (SCC), actinic keratosis (AK), or pre-AK lesions. Results are shown in Table 9.

10

The disease state of each mouse was scored by measuring the number of lesions present on the mouse. All SCC lesions, AK lesions, and pre-AK lesions were given a score of 1.

Table 9

Treatment	No. of Mice	Diseased	% Disease	Avg. Disease Score
UV Exposed - IRM 3	10	3	30	1.00 ± 0.54
UV Exposed - IRM 4	9	1	11	0.67 ± 0.67

UV Exposed – non- IRM	8	7	88	10.25 ± 2.06
No UV exposure	5	0	0	0.00 ± 0.00

Example 5

Subjects with four to eight clinically typical, visible, discrete actinic keratosis (AK) lesions in a 25 cm² treatment area were randomized in a 1:1 ratio to receive either a 5% cream formulation of IRM14 (ALDARA, 3M Company, St. Paul, MN) or vehicle cream once daily three days per week. Subjects received treatment for sixteen weeks even if clinical evidence of lesion clearance was observed. Subjects were evaluated at an Evaluation visit eight weeks after the treatment period concluded.

Subjects were instructed to administer a single application of cream (vehicle or IRM14, as assigned) to the treatment area at approximately the same time of day three days per week. The subjects were instructed to wash the treatment area prior to applying the cream, rub the cream into the treatment area, and then leave the cream in place for at least eight hours without occlusion.

Subjects with no (zero) clinically visible AK lesions in the 25 cm² treatment area at the Evaluation visit were considered complete responders. 117 of 242 (48.3%) subjects receiving IRM14 were complete responders; 18 of 250 (7.2%) vehicle-treated subjects were complete responders.

Complete responders were re-evaluated for recurrence of AK lesions at a Follow-up visit between 12 and 18 months after the Evaluation visit. Subjects received

no IRM14 treatment between the Evaluation visit and the Follow-up visit. The 25 cm² treatment area was examined for clinical evidence of AK. The AK recurrence rate for each treatment group was computed as the percentage of complete responders completing the Follow-up visit in each treatment group (77 IRM14-treated, 12 vehicle-treated) that experienced recurrence of AK lesions at the Follow-up visit. The results are summarized in Table 10.

Table 10

<u>Treatment</u>	<u>AK Recurrence Rate</u>
IRM14	24.7 %
vehicle	50.0 %

Various modifications and alterations to this invention will become apparent to those skilled in the art without departing from the scope and spirit of this invention. Illustrative embodiments and examples are provided as examples only and are not intended to limit the scope of the present invention. The scope of the invention is limited only by the claims set forth as follows.

What is Claimed is:

1. A method of protecting a subject against UV-induced epidermal neoplasia, the method comprising administering to a subject an IRM compound in an amount effective to provide protection against UV-induced epidermal neoplasia.
2. The method of claim 1 wherein the subject is a mammal.
3. The method of claim 2 wherein the subject is a human.
4. The method of claim 1 wherein the IRM compound is administered at least once per month.
5. The method of claim 1 wherein the UV-induced epidermal neoplasia comprises melanoma, basal cell carcinoma, squamous cell carcinoma, actinic keratosis, or pre-actinic keratosis lesions.
6. The method of claim 1 wherein administering the IRM compound protects against epidermal neoplasia induced by UVA or UVB.
7. The method of claim 1 wherein the IRM compound is administered in a topical formulation.
8. The method of claim 7 wherein the formulation comprises from about 0.0001% to about 10% IRM compound, by weight.
9. The method of claim 7 wherein the formulation comprises an adjuvant.
10. The method of claim 7 wherein the topical formulation is a cream, an ointment, an aerosol formulation, a non-aerosol spray, a gel, or a lotion.
11. The method of claim 7 wherein the formulation comprises at least one sunscreen agent.

12. The method of claim 7 wherein the formulation comprises a cosmetic.
13. The method of claim 1 wherein administration of the IRM compound occurs
5 before the subject is exposed to UV radiation.
14. The method of claim 1 wherein administration of the IRM compound occurs
after the subject has been exposed to UV radiation.
- 10 15. The method of claim 1 wherein the IRM compound is administered to the
subject in a dose of from about 10 µg/kg to about 5 mg/kg.
16. The method of claim 1 wherein the epidermal neoplasia comprises at least on
recurrent lesion.
15
17. A composition comprising:
an IRM compound; and
a sunscreen agent.
- 20 18. A composition comprising:
an IRM compound; and
a cosmetic.
